Summary

Bilenko T. Socio-Cultural Aspect of Linguistic Identity Formation. Language personality begins to emerge spontaneously. The child learns the words of the closest environment, forming himself due to its (environment) standards. But over time, as an autonomous constituent of the society, the person puts his actions and aspirations into words that capture awareness of his sovereignty. Having verbal social resources at his disposal, the individual forms his own acquisition under the pressure of real needs, and his vocabulary contains the words necessary for optimal functioning in the society. Here there is not spontaneous but conscious choice of a necessary word (words), due to the social status of the man, his cultural and educational level and demand. Keywords: social, cultural, linguistic identity, language personality, verbal social resources.
